Figure 1. Graph illustrating the 3-dimensional association of glucose x trunk fat on mean EPI levels (a) and cortisol levels (b) during the anger recall task. Glucose was divided into the following groups (y-axis on left): G1 = <85mg/dl, G2 = 85-90mg/dl, G3 = 90-95 mg/dl and G4 = >95 mg/dl. Trunk fat quartile groups (x-axis on right) were Q1 = <15%, Q2 = 15-22%, Q3 = 22-30% and Q4 = >30%.
